

Datadragon®

Internet Access

Datadragon® analyzes and optimizes individual applications as they are received from the networks by the Isotropic VSAT hub.

With Datadragon, the bandwidth supplied by Isotropic reaches the LAN (local area network) fully optimized for allocation across individual users and devices.

THE RESULTS...

INCREASED VISIBILITY
by providing users with a real-time picture of bandwidth utilization, down to the application level, across any single VSAT network.

OPTIMIZED ACCESS
by giving users control, letting them see, allocate, and purchase bandwidth based on their unique needs.

REDUCED FRICTION
through Datadragon's analytics and AI to provide Internet access that simply "works" by automatically allocating bandwidth based on user history and demand.
